Anticipatory action can save >\$120B in aid annually

Data availability challenges food insecurity predictions

Compounding crises are accelerating **faster than systems can track.**

Traditional data is **infrequent, incomplete, and delayed.**

Early warning **requires data in time.** Without, response is reactive and more lives are lost.

Data availability challenges food insecurity predictions

Compounding crises are accelerating faster than systems can track.

Traditional data is **infrequent**, **incomplete**, and **delayed**.

Early warning **requires data in time**. Without, response is reactive and more lives are lost.

Two-part answer

Sustained investment in on-the-ground data collection remains essential.

Research innovation to help close the data gap.

Local news captures food crises **before** structured data

*The **conflict** has also played a large part in causing a **cholera epidemic** and leaving millions facing **famine** and **severe malnutrition** [...]"*

Output

High-frequency, district-level signal on a multi-dimensional **set of risks** + food insecurity **predictions**

More accurate and explainable food crisis forecasting

Crop pests in South Sudan, news signals months earlier

Conflict in Somalia, fatality counts missed signal

Mar 2011

News mentions of
conflict and violence

Jul 2011

No records of
fatalities

IPC Phase 4

Extreme weather in Ethiopia, but regular rainfall patterns

Making data + research insights openly accessible

Insights from **143mn articles**
+ **99k news sources**.

Access via **data API** +
interface.

Integration with WFP via
country pilots in Nigeria +
Mozambique.

Thank you!
